

# CSE 421 Lab 3

## Home Work

4. Create a basic client-server program where the server takes the number of hours a person worked from the client and calculates the person's salary.

- If the hours worked are less than or equal to 40, then the person receives Tk 200 per hour.
- If the hours worked are greater than 40, then the person receives Tk 8000 plus Tk 300 for each hour worked over 40 hours.

The client will provide how many hours the person worked to the server and the server will calculate the salary and send it to the client.
